1 Outline of the Product

Preface

Thank you for choosing our gas leak detector SP-220 series (hereinafter referred to as the detector). Please check that the model number of the product you purchased is included in the specifications on this manual.

This manual explains how to use the gas detector and its specifications. It contains information required for using the detector properly. First-time users and users who have already used the product must read and understand the operating manual to enhance the knowledge and experience before using the detector.

Note that the contents of this manual are subject to change without notice for product improvement. It is also prohibited to copy or reproduce this manual, in whole or in part, without permission.

Regardless of warranty period, we shall not make any indemnification for accidents and damage caused by using the detector.
Make sure to read the warranty policy specified on the warranty.

Purpose of use

This detector is used to detect a single channel, such as hydrogen phosphide (phosphine: PH3), etc., in air. It provides two different specifications: TYPE FUM used to detect leakage of fumigation gases and TYPE SC used to detect leaking of general gases including semiconductor material gases. Detection results are not intended to guarantee life or safety in any way.

Definition of DANGER, WARNING, CAUTION and NOTE

Throughout this manual, the following indications are used to ensure safe and effective work.

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="danger_icon.png" alt="DANGER" /> DANGER</td>
<td>This message indicates that improper handling may cause serious damage on life, health or assets.</td>
</tr>
<tr>
<td><img src="warning_icon.png" alt="WARNING" /> WARNING</td>
<td>This message indicates that improper handling may cause serious damage on health or assets.</td>
</tr>
<tr>
<td><img src="caution_icon.png" alt="CAUTION" /> CAUTION</td>
<td>This message indicates that improper handling may cause minor damage on health or assets.</td>
</tr>
<tr>
<td><img src="note_icon.png" alt="NOTE" /> NOTE</td>
<td>This message indicates advice on handling.</td>
</tr>
</tbody>
</table>
2

Important Notices on Safety

To maintain the performance and use the gas detector safely, observe the following instructions of DANGER, WARNING, and CAUTION.

2-1. Danger cases

**DANGER**

About use
- This is not an explosion-proof detector. You must not use it to detect gases exceeding the lower explosive limit (LEL).
- While conducting measurement in a manhole or confined space, do not lean over or look into the manhole or closed space. It may lead to dangers because oxygen-deficient air or other gases may blow out.
- Oxygen-deficient air or other gases may be discharged from the gas exhausting outlet of the detector. Never inhale the air or gases.
- High-concentration (100% LEL or higher) gases may be discharged from the gas exhausting outlet of the detector. Never use fire near it.
2-2. Warning cases

**WARNING**

Sampling point pressure
- The concentration meter is designed to draw gases under the atmospheric pressure. If excessive pressure is applied to the gas inlet and outlet of the detector, measured gases may leak out from its inside and may cause dangerous conditions. Be sure that excessive pressure is not applied to the detector’s gas inlet or outlet while used.

Air calibration in atmosphere
- Perform an air calibration in a fresh air environment. If interference gases exist, the adjustment cannot be performed properly, thus leading to dangers when gas is present.

Response to gas alarm
- A gas alarm is triggered by changes in temperature and humidity. In such a case, check the atmosphere for freshness and perform air calibration again in the measured atmosphere. Example) If the detector is turned on in a room with a temperature of 20ºC and a humidity of 40% RH and taken outside (a temperature of 30ºC and a humidity of 60% RH), an alarm is triggered by humidity changes. In such a case, perform air calibration outside and measure. The detector performs air calibration automatically when it is turned on. Even in such a case, check the atmosphere for freshness and perform air calibration again in the measured atmosphere.

**WARNING**

Battery level check
- Before use, check that there remains sufficient battery power. When the detector is not used for a long period, the batteries may be exhausted. Never fail to replace them with new ones before use.
- If a low battery voltage alarm is triggered, gas detection cannot be conducted. If the alarm is triggered during use, turn off the power and promptly replace the batteries in a safe area.

Others
- Do not throw the detector into fire.
- Do not wash the detector in a washing machine or ultrasonic cleaner.
- Do not block the buzzer sound opening. No alarm sound can be heard.
- Do not remove the battery while the power is on.
2-3. Precautions

CAUTION

Do not expose the detector to oil, chemicals, etc. Do not submerge the detector under water.

- Do not use in a place where the detector is exposed to liquids such as oil, chemicals, etc.
- The detector is not water-pressure-resistant. Do not use the detector where a high water pressure is applied to it (under a faucet, shower, etc.) or submerge it under water for a long time. The detector is water-proof only in fresh water and running water, and not in hot water, salt water, detergent, chemicals, human sweat, etc.
- The gas inlet and outlet are not water-proof. Be careful not to let water such as rainwater, etc. get into these parts. Because this may cause trouble and gas cannot be detected.
- Do not place the detector where water or dirt gets accumulated. The detector placed at such a location may cause malfunction due to water or dirt that gets into the buzzer opening, etc.
- Note that drawing in dirty water, dust, metallic powder, etc. will significantly deteriorate the sensor sensitivities. Be careful when the detector is used in an environment where these elements exist.

Do not use the detector in a place where the temperature drops below -20°C or rises over 55°C.

- The operating temperature of the detector is -20 to +55°C. Do not use the detector at higher temperatures, humidities and pressures or at lower temperatures than the operating range.
- Avoid long-term use of the detector in a place where it is exposed to direct sunlight.
- Do not store the detector in a sun-heated car.
- Avoid a sudden humidity or temperature change.
- Do not leave the detector in a place with high temperature and humidity for a long time. The performance of the detector may deteriorate.

Observe the operating restrictions to prevent condensation inside the concentration meter or gas sampling hose.

- Condensation formed on the detector or taper nozzle causes clogging or gas adsorption, which may disturb accurate gas detection. Thus, condensation must be avoided. In addition to the installation environment, carefully monitor the temperature/humidity of the sampling point to prevent condensation on the detector or taper nozzle. Please observe the operating restrictions.

Do not use a transceiver near the detector.

- Radio wave from a transceiver near the detector may disturb readings. If a transceiver or other radio wave transmitting device is used, it must be used in a place where it disturbs nothing.
- Do not use the detector near a device that emits strong electromagnetic waves (high-frequency or high-voltage devices).

Verify that the flow check display is rotating before using the detector

- If the pump driving indicator is not rotating, gas cannot be measured properly. Check whether the flow rate is lost.

Never fail to perform a regular maintenance.

- Since this is a precision device, regular maintenance must be performed. Continuing to use the detector without performing maintenance will compromise the sensitivity of the sensor, thus resulting in inaccurate gas detection.
CAUTION

Others

- Exposing the sensor to a gas for a long time or a high-concentration gas may result in that the
gas alarm will remain for a certain period. If the exposure occurs, allow the instrument to draw
fresh air for more than 5 minutes (recommendation), and then perform air calibration again.
- Pressing buttons unnecessarily may change the settings, preventing alarms from activating
correctly. Operate the detector using only the procedures described in this operating manual.
- Do not drop or give shock to the detector. The accuracy of the gas detector may be
deteriorated.
- Do not jab the buzzer opening with a sharp-pointed item. Doing so may cause a failure or
damage.
- Do not remove the panel sheet on the display. The water-proof and dust-proof performances
will be deteriorated.
- Do not affix a label or the like on the infrared port. Infrared communications can no longer be
conducted.
- The operating environment may include gases that have harmful effects on the sensor of the
detector. The detector cannot be used in the presence of the following gases:
  (1) High-concentration sulfides (such as H2S, SO2, etc.)
  (2) Halogen gases (such as chloride compounds, etc.)
  (3) Silicone (Si compounds)
  (4) High-concentration solvent gases

Do not use the detector in the presence of the above (1), (2), and (3) gases (such as
high-concentration sulfides, halogen gases, silicone, etc.), which may shorten the sensor life
significantly or cause malfunctions such as inaccurate readings.

In case the gas detector is used for detection in the presence of silicone, etc., be sure to check
the gas sensitivities before using it again.

If the above (4) gas (high-concentration solvent gas) is exposed, a crack may occur in the
detector. Thus, do not use high-concentration solvent gases.

About battery replacement

- Never fail to turn off the power of the detector before replacing the batteries.
- Replace both of the two batteries with new ones at one time.
- Pay attention to the polarities of the batteries.

Usage

- In a low-temperature environment, the operating time is shortened due to the battery
  performance property.
- At low temperatures, the responses of the LCD display may slow down.
- Perform air calibration under pressure and temperature/humidity conditions close to those in
  the operating environment and in fresh air.
- Perform air calibration after the reading is stabilized.
- If there is a sudden temperature change of 15°C or more between the storage and operational
  locations, turn on the power of the gas detector, let it stand for about 10 minutes in a similar
  environment to the operational location, and perform air calibration in fresh air before using it.
- When cleaning the gas detector, do not splash water over it or use organic solvents such as
  alcohol and benzine on it. The surface of the gas detector may be discolored or damaged.
- If the gas detector is not used for a long time, turn on the power at least once every six months
  and check that the pump draws in air (about three minutes). The gas detector, when not
  activated for a long time, may cease to work because of hardening of the grease in the pump
  motor.
- If the gas detector is not used for a long time, store it after removing the batteries. Battery leaks
  may result in fire, injury, etc.
- When the detector is used again after a long-period storage, never fail to perform air
  calibration. For information on readjustment including air calibration, please contact RKI.
3
Product Components

3-1. Names and functions for each part

This section describes names and functions of main unit and battery unit parts and LCD display.

Main unit

<table>

<td>Gas name and message display</td>
<td>Displays the gas name and a message according to the function.</td>
</tr>
</tbody>
</table>

**NOTE**

- The meanings of battery level icons are as follows:
  - 🍑: Sufficient  /  🍓: Low  /  🍓: Needs replacement
  - If the battery level further drops, the inside of the battery icon starts to blink ( 🍓 ).
4
How to Use

4-1. Before using the detector

First-time users and users who have already used the detector must follow the operating precautions. Ignoring the precautions may damage the unit, resulting in inaccurate gas measurement.

4-2. Preparation for start-up

Before use, read and understand the following precautions. Ignoring these may cause inaccurate gas detection.

- The batteries are installed (with sufficient battery level).
- Check that the taper nozzle and filter are not contaminated.
- Check that the taper nozzle is not bent or has no hole.
- Check that the nipple to which the taper nozzle is attached is not loose.

4-3. How to replace the batteries

When the detector is used for the first time, or when the battery level is low, attach two new AA alkaline batteries according to the following procedures.

1. Check that the power of the detector is turned off.
   Turn off the power if it is turned on.
2. Turn the lock plate counterclockwise and open the battery cover.
3. Remove old batteries and then put new batteries while observing the correct polarity.
4. Close the battery cover and turn the lock plate clockwise to lock.
CAUTION

- Never fail to turn off the power of the detector before replacing the batteries.
- Replace the batteries in a safe place.
- Replace both of the two batteries with new ones at one time.
- Pay attention to the polarities during replacement. Replace while checking the battery polarities stamped on the body.
- If the battery cover is not completely locked, the dry batteries may become dislodged or water may get in through the clearance. Water may also get in if a minute foreign substance is caught between the detector and battery cover.
4-4. How to start the detector

When the power is turned on, a self-diagnostic starts, and then the detector enters the detection mode.

Power-on

Press and hold the POWER button until the buzzer blips (one second or longer) to turn on the power. When the power is turned on, the LCD display changes automatically as shown below, and the detector enters the detection mode.

(Display example: FUM version)

1. Press and hold the POWER button for one second or longer.
   Hold it down until all the LCDs and alarm lamp light up and the buzzer blips.

<table>
<thead>
<tr>
<th>All LCDs light up</th>
<th>Date/time display</th>
<th>Gas name/full scale display</th>
<th>Warm-up time</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="All LCDs light up" /></td>
<td><img src="image" alt="Date/time display" /></td>
<td><img src="image" alt="Gas name/full scale display" /></td>
<td><img src="image" alt="Warm-up time" /></td>
</tr>
</tbody>
</table>

   Display example:
   Thursday, October 01, 2015
   12:34

   Detection mode
   Automatic air calibration display

   The buzzer blips once and the detection mode is displayed.
* The date/time display is displayed only when the clock function is enabled. It is not normally displayed because the clock function is disabled by default. To enable the clock function, see "6-3. Clock function ON/OFF setting" on page 36.

**NOTE**

- When powering on after leaving the detector for more than five minutes with the batteries removed, such as when powering on for the first time, replacing the batteries, etc., or powering on with the batteries inserted with incorrect polarities, a clock abnormality (FAIL CLOCK) may be triggered. When it is reset using the MODE button, the detector moves to the date/time setting screen. See "6-2. Date/time setting" on page 35 and set the date/time.
- Warm-up time (WARM UP) is different depending on the stability status of the sensor.
- If the detector is not used for a long period, warm-up time may be longer or a sensor abnormality (FAIL SENSOR) may be displayed. In such a case, restart the detector.
- The detector performs air calibration automatically on start-up. If an environment where the detector is turned on is different from the atmosphere being measured, perform an air calibration again in the atmosphere being measured.

**About LCD backlight**

- Pressing the [AIR] [MODE] or [POWER] button turns on the LCD backlight. The LCD backlight goes off after 30 seconds or so of no operation. When an alarm is triggered, the LCD backlight lights up automatically.
4-5. Basic operating procedures

The detection mode is used after power-on. Gas is detected in the ppm range.
(Display example: FUM version)

<table>
<thead>
<tr>
<th>AIR + POWER buttons</th>
<th>Hold down for 3 secs</th>
<th>&lt;Operation/alarm sound ON/OFF&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE button</td>
<td>Hold down for 1 sec</td>
<td>&lt;Peak clear&gt;</td>
</tr>
<tr>
<td></td>
<td>Hold down for 3 secs</td>
<td>&lt;Peak hold ON/OFF&gt;</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&lt;Display mode&gt;</td>
</tr>
</tbody>
</table>

* Displayed only when the clock function is enabled. See "6-3. Clock function ON/OFF setting" on page 36.
4-6. How to detect

While operating in detection mode, put the tip of the nozzle close to the detection area to draw sample. The detector measures gas in the ppm range.

**FUM-type instruments:** The gas concentration is displayed as a bar graph.

**SC-type instruments:** A digital gas reading is displayed in detection mode (when the selected gas is PH3) along with a bar graph. If any gas other than PH3 is selected, the digital reading will not display. If the peak hold function is turned ON, the digital reading will not display. The digital reading is not displayed in the Peak screen in Display Mode and is not displayed or saved if a snap log operation is performed.

![FUM Type](image1)
![SC Type](image2)

**DANGER**

- While conducting measurement in a manhole or confined space, do not lean over or look into the manhole or closed space. It may lead to dangers because oxygen-deficient air or other gases may blow out.
- Oxygen-deficient air or other gases may be discharged from the gas exhausting outlet of the detector. Never inhale the air or gases.
- High-concentration (100% LEL or higher) combustible gases may be discharged from the gas exhausting outlet of the detector. Never use fire near it.

**WARNING**

- The detector is designed to draw gases around it under the atmospheric pressure. If excessive pressure is applied to the gas inlet and outlet of the detector, detected gases may leak out from its inside and may cause dangerous conditions. Be sure that excessive pressure is not applied to the detector.
- When performing an air calibration, verify that you are in a fresh air environment before starting. If interference gases exist, the adjustment cannot be performed properly, thus leading to dangers when the gas leaks.
- Issuance of a gas alarm indicates that there are extreme dangers. Take proper actions based on your judgment.
- Before use, check that there remains sufficient battery power. When the detector is not used for a long period, the batteries may be exhausted. Never fail to replace them with new ones before use.
- If a low battery alarm occurs, gas detection cannot be conducted. If the alarm is triggered during use, turn off the power and promptly replace the batteries in a safe area.
- Do not block the buzzer sound opening. No alarm sound can be heard.
- If the main unit is dropped or given a shock, the reading may rise and it may remain so. In such a case, perform air calibration in a place where the surrounding air is fresh.
4-7. Changing the concentration measuring mode

In the detector, the detection gas type is factory set to PH3 (phosphine) and the alarm setpoint is factory set to 0.1 ppm.

The alarm setpoint mode can be changed, depending on the gas to be detected, in three levels for fumigation gases and two levels for semiconductor material gases.

For the concentration measuring for fumigation gases, the concentration measuring mode or differential measuring mode can be selected.

In the differential measuring mode, "LOW MODE" and "HIGH MODE" can be switched.

**<Concentration measuring mode>**

Perform air calibration in the atmosphere.

Then, the mode monitors changes to the air value, showing the correlation between a leakage amount and the bar display.

(If the measured atmosphere changes, perform air calibration again.)

**<Differential measuring mode>**

Perform automatic air calibration at regular intervals in the atmosphere of measurement environment. This is a high sensitivity mode that enables detection of ultralow amounts of leaking gas in the air by eliminating the environmental effects (other gases, temperature and humidity). Since it can detect a slight amount of increase in gas concentration even in the environment where a gas is leaking already, this measuring mode is effective to identify a leaking point.

---

**Gas alarm setpoint for concentration measuring mode (for fumigation gases)**

1. In the detection mode, press the **AIR** and **MODE** buttons at the same time.

   The alarm setpoint is changed to the next pre-defined setpoint every time the **AIR** and **MODE** buttons are pressed. There are 3 setpoints total, all in the ppm range.

---
Gas alarm setpoint for concentration measuring mode (for semiconductor material gases)

1. In the detection mode, press the \textbf{AIR} and \textbf{MODE} buttons at the same time. The alarm setpoint is changed to the next pre-defined setpoint every time the \textbf{AIR} and \textbf{MODE} buttons are pressed. There are 2 setpoints total, all in the ppm range.

Gas alarm setpoint for differential measuring mode (only for fumigation gases)

1. In the detection mode, press the \textbf{AIR} and \textbf{MODE} buttons at the same time. The alarm setpoint is changed to the next pre-defined setpoint every time the \textbf{AIR} and \textbf{MODE} buttons are pressed. There are 6 setpoints total.
Change of gas alarm sensitivity for differential measuring mode (only for fumigation gases)

1. In the detection mode, press the **AIR** button.
   The alarm sensitivity changes from LOW MODE to HIGH MODE every time the **AIR** button is pressed.

   ![Diagram](image1.png)

   ![Diagram](image2.png)

**CAUTION**
- Performing an automatic air calibration in the presence of gas will decrease the bar meter.
- For excessive temperature/humidity changes, the bar meter may increase.
- When the mode is switched from the differential mode to the concentration measuring mode, check the atmosphere for freshness and perform air calibration again in the measured atmosphere.
- The gas concentration is displayed in six levels (without a unit).
- Air calibration is performed automatically and it cannot be performed manually.

**NOTE**
- For switching to the differential measuring mode (for fumigation gases), see "Change of the measuring mode" in the display mode on page 31.
4-8. Perform an air calibration

After a high-concentration gas is detected or an alarm is triggered by temperature/humidity changes, perform an air calibration in the measured atmosphere.
* Before performing air calibration, verify a fresh air environment.
(Example: For fumigation gases)

1. In the detection mode, hold down the **AIR** button.

(Example: For fumigation gases)

2. Release the AIR button when the display changes from "HOLD **AIR**" to "RELEASE".

(Buzzer sound: Three times <blip, blip, blip>)

The air calibration is done and the gas detector returns to detection mode.
(Buzzer sound: Once <blip>)

If air calibration fails, "FAIL AIR CAL" is displayed.
Perform air calibration again in fresh surrounding air.
NOTE

• Perform air calibration under pressure and temperature/humidity conditions close to those in the operating environment and in fresh air.
• Perform an air calibration after the reading is stabilized.
• If there is a sudden temperature change between the storage and operational locations, turn on the power of the detector, let it stand for ten minutes or more in a similar environment to the operational location, and perform air calibration in fresh air before using it.

4-9. Snap logger

Any peak value during measurement can be recorded. Up to 256 points of data can be recorded. When the number of recorded data points reaches the maximum, recorded data will be overwritten, starting from the oldest data. This function is enabled when the clock function is enabled. Since the clock function is disabled by default, enable it before using the snap logger function (See "6-3. Clock function ON/OFF setting" on page 36).

1. In the detection mode, press the MODE and POWER buttons at the same time. The detector enters the station ID selection screen.

2. Use the MODE or AIR button to select the station ID and press the POWER button. The peak value is displayed. To stop recording, press the AIR and MODE buttons at the same time. The detector returns to the detection mode.

3. Press the POWER button. The date/time and peak value are recorded. To continue recording the log, repeat steps 2 to 3. To stop recording the log, press the AIR and MODE buttons at the same time. The detector returns to the detection mode.

NOTE

• The recorded data can be read out by the "Data Logger Management Program" (optional). See the operating manual of "Data Logger Management Program" for more information.
4-10. Peak hold function

When the peak hold function is enabled, the latest peak value is always displayed with the bar meter.
(Display example: For fumigation gases)

1  In the detection mode, hold down the MODE button (for three seconds or longer).
The peak hold function is enabled. While the peak hold function is enabled, "P" is displayed on the LCD display.

To disable the peak hold function, hold down the MODE button for three seconds or longer.

NOTE
- To clear a saved peak value, hold down the MODE button (for one second) in the detection mode.

4-11. Changing the alarm and operation sounds

Turn the alarm and operation sounds ON or OFF.
(Display example: For fumigation gases)

1  In the detection mode, press the AIR and POWER buttons at the same time.
The settings for the alarm and operation sounds are switched every time the AIR and POWER buttons are pressed.

Alarm sound ON  Alarm sound OFF  Alarm sound OFF  Alarm sound ON
Operation sound ON Operation sound ON Operation sound OFF Operation sound OFF
4-12. How to turn on the illumination lamp

The illumination lamp can be turned on, if necessary.

1. Hold down the **AIR** and **POWER** buttons at the same time (for three seconds or longer).

   The illumination lamp lights up. The illumination lamp will automatically go off two minutes after it lights up.

   To turn off the illumination lamp, hold down the **AIR** and **POWER** buttons at the same time (for three seconds or longer).

4-13. Power-off

Press and hold the **POWER** button (at least three seconds) until the buzzer blips three times ("TURN OFF" disappears) to turn off the power.

**CAUTION**

- If a gas remains in the detector, it enters the automatic exhaust mode (for a maximum of 30 seconds). The detector is turned off after the automatic exhaust mode is complete. The mode counts down from automatic exhaust start (PURGE 30). The detector switches to the "TURN OFF" display when the gas exhaust is completed and is turned off.

![Automatic exhaust start (PURGE 30)](image-url)
5
Display Mode

5-1. Entering the display mode

This mode allows users to view and change various display settings.
(Display example: For fumigation gases)

1. In the detection mode, press the **MODE** button.
The detector enters the peak value display in the display mode.

2. Next, press the **MODE** button to display the appropriate menu.
The setting screen for the display mode is switched every time the button is pressed.

3. Select the setting item and press the **POWER** button.
For setting items, see “Display mode overview” on page 25.

**NOTE**
- The detector automatically returns to the detection mode in about 20 seconds if the detector is left unoperated.
- Gas detection is continued in the display mode and an alarm can be activated.
## Display mode overview

5-2. Concentration displayed gas reading setting

Normally, the concentration display of the detector is "phosphine (PH3)" depending on the specification; however, a pre-registered gas can be read instead to detect its concentration. (Display example: For fumigation gases)

1. On the “GAS LIST” screen in the display mode, press the POWER button. The detector enters the gas reading setting.

2. Press the MODE or AIR button to select a gas name to be read instead. The gas name switches to another every time the button is pressed.

3. When the target gas name is displayed, press the POWER button. “END” is displayed, returning to the display mode.
To perform the concentration displayed gas reading setting, see the "Gas list" in the following page.

### Gas list for fumigation gases

* - (bar display) has no scale.

### NOTE

- High-concentration or continuous contact with a chloride or sulfur compound will shorten the sensor life or cause larger errors.
- If a Si compound is detected, the sensitivity will decrease, shortening the sensor life.
- Even for a gas shown only with the bar meter display but no scales, the meter reads Scale 2 or 3. Use it as an indication of concentration increase.
- If a high-concentration solvent gas is drawn, the rubber seal or other part used in the detector will deteriorate.

* - (bar display) has no scale.
NOTE

- High-concentration or continuous contact with a chloride or sulfur compound will shorten the sensor life or cause larger errors.
- If a Si compound is detected, the sensitivity will decrease.
- Even for a gas shown only with the bar meter display but no scales, the meter reads Scale 2. Use it as an indication of concentration increase.
- If a high-concentration solvent gas is drawn, the rubber seal used in the detector will deteriorate.
5-3. Changing the measuring mode (only for fumigation gases)

The measuring mode of the detector (for fumigation gases) can be switched from "concentration measuring mode" to "differential measuring mode", where lower concentration detection can be conducted.

1. On the "MODE CHG" screen in the display mode, press the POWER button. The detector enters the setting to switch the measuring mode.

2. Press the MODE or AIR button to select the measuring mode. The measuring mode switches to the other every time the button is pressed.

3. With the appropriate measuring mode displayed, press the POWER button. "END" is displayed, returning to the display mode.
5-4. Log data display

The data recorded by the snap logger can be viewed. The "REC DATA" screen is displayed only when the clock function is enabled (See "6-3. Clock function ON/OFF setting" on page 36).

(Display example: For fumigation gases)

1. On the "REC DATA" screen in the display mode, press the POWER button.
   The detector enters the log data display.
   The recorded date/time is displayed and the station ID and memory number are displayed alternately. If there is no recorded data, "NO DATA" is displayed.

   ![Display example: For fumigation gases](image)

   * When there is no recorded data

2. Press the MODE or AIR button to select log data to be displayed.
   The recorded content switches to the other every time the button is pressed.

   ![Display example: For fumigation gases](image)

3. When the target log data is displayed, press the POWER button.
   The gas name and peak value of the selected memory are displayed alternately.

   ![Display example: For fumigation gases](image)

4. To exit the display, press the MODE and AIR buttons at the same time.
   The detector returns to the display mode.
6
User Mode

6-1. Entering the user mode

The maintenance including internal clock correction, etc. can be performed.
(Display example: For fumigation gases)

1. In the detection mode, press the [MODE] button a few times to display entering user mode, press the [POWER] button
   The detector enters the date/time setting in the user mode.

2. Next, press the [MODE] button to display the appropriate menu.
   The setting screen for the user mode switches to another every time the button is pressed.

3. Select the setting item and press the [POWER] button.
   For setting items, see "User mode overview" on page 34.

CAUTION

- Return to the detection mode after use.
## User mode overview

<table>
<thead>
<tr>
<th>Item</th>

<td>![ROM/SUM Icon]</td>
<td>Displays the program number and SUM value of the detector. * This is not typically used by the user.</td>
</tr>
<tr>
<td><strong>Entering detection mode</strong></td>
<td>![MEASURE Icon]</td>
<td>To exit the user mode, press the <strong>POWER</strong> button to enter the detection mode.</td>
</tr>
</tbody>
</table>
6-2. Date/time setting

Set the date/time of the internal clock. The date/time setting screen is displayed only when the clock function is enabled. Enable the clock function in "6-3. Clock function ON/OFF setting" on page 36 before setting the date/time.

1. On the "DATE" screen in the user mode, press the [POWER] button.
The detector enters the date/time setting.

2. Press the [MODE] or [AIR] button, set the date/time and press the [POWER] button.

3. Set year -> month -> day -> hour -> minute in this order.

When the "minute" value is confirmed, "END" is displayed and then the detector returns to the user mode menu.
6-3. Clock function ON/OFF setting

Enable or disable the clock function. The clock function is disabled by default. If the date/time needs to be displayed on start-up or the snap logger function is used, enable the clock function.

1. **On the "CLOCK" screen in the user mode, press the POWER button.**

2. **Use the MODE or AIR button to display the desired setting (ON/OFF) and press the POWER button to confirm it.**

3. **Setting completed**

   After the clock function ON/OFF setting is completed, "END" is displayed and then the detector returns to the user mode menu.

**NOTE**
- When the clock function is changed from OFF to ON, a clock abnormality (FAIL CLOCK) may be triggered if the date/time is inaccurate. When the failure condition is reset using the MODE button, the detector moves to the date/time setting screen. Set the date/time in accordance with "6-2. Date/time setting" on page 33.
- When the clock function is changed from OFF to ON for the first time, powered on after leaving the detector for more than five minutes with the batteries removed, or powered on with the batteries inserted with incorrect polarities, a clock abnormality (FAIL CLOCK) may be triggered.
7
Alarm Function

7-1. Gas alarm activation

When the concentration of detected gas reaches or exceeds the alarm setpoint values, a "gas alarm" is triggered in the detector. The alarm lamp blinks, the buzzer sounds, and the bar meter display indicates an alarm condition. (Auto-reset operation)

The blinking alarm lamp and buzzer sound operation for gas alarms have different intervals depending on the detected concentration.

7-2. Fault alarm activation

"Fault alarm" is triggered using a buzzer sound and blinking alarm lamp when an abnormality is detected in the detector. (Self-latching)

When an alarm is triggered, one of the following fault details is displayed on the LCD.

- System abnormalities: FAIL SYSTEM
- Calibration abnormalities: FAIL AIR CAL
- Low flow rate: FAIL LOW FLOW
- Pump abnormalities: FAIL PUMP
- Sensor abnormalities: FAIL SENSOR
- Low battery voltage: FAIL BATTERY
- Clock abnormalities: FAIL CLOCK

Alarm lamp
Repeatedly blinks at about one-second intervals.

Buzzer
Repeatedly sounds intermittent beeps at about one-second intervals.
Blip-blip, blip-blip

LCD display
Display example of low flow rate (LOW FLOW)

If a fault alarm is triggered, determine the cause and take appropriate action.
If the detector has problems and is repeatedly malfunctioning, contact RKI immediately.

NOTE
- The low flow rate alarm (FAIL LOW FLOW) can be reset by pressing the MODE button.
- For information on malfunctions (error messages), see "Troubleshooting" on page 45.
8
Maintenance

The detector is a precision device. To maintain the performance of the detector and improve the reliability of detecting leakage, perform regular maintenance.

8-1. Maintenance intervals and items

Perform the following maintenance regularly before use.

- Daily maintenance: Perform maintenance before each day’s use.
- Monthly maintenance: Perform alarm test once a month.
- Regular maintenance: Perform maintenance once or more during a one year period to maintain the unit’s performance.

<table>

About maintenance services

We provide services on regular maintenance including span adjustment, other adjustments and maintenance. To make the calibration gas, dedicated tools, such as a gas cylinder of the specified concentration, gas sampling bag, etc., must be used. Our qualified service engineers have expertise and knowledge on the dedicated tools used for services, along with other products. To maintain the safety operation of the gas detector, please use our maintenance service.

The followings are typical maintenance services. For details, contact RKI.

<Main Services>

<table>
<thead>
<tr>
<th>Item</th>
<th>Services</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery level check</td>
<td>Checks the battery level.</td>
</tr>
<tr>
<td>Concentration display check</td>
<td>Verifies that the concentration display value is zero by using the zero gas. Performs the air calibration if the reading is incorrect.</td>
</tr>
<tr>
<td>Flow rate check</td>
<td>Checks the flow rate indicator to find abnormalities. Checks the flow rate by using an external flow meter to verify the correctness of the flow rate indicator on the detector. If the flow rate is incorrect, performs the flow rate adjustment.</td>
</tr>
<tr>
<td>Filter check</td>
<td>Checks the dust filter for dust or clogging. Replaces a dirty or clogged dust filter.</td>
</tr>
<tr>
<td>Span adjustment</td>
<td>Performs span adjustment using a calibration gas.</td>
</tr>
<tr>
<td>Cleaning and repair of the unit (visual diagnosis)</td>
<td>Checks dust or damage on the surface of the unit, cleans and repairs such parts. Replaces parts which are cracked or damaged.</td>
</tr>
<tr>
<td>Unit operation check</td>
<td>Operates the buttons to check the operation of functions and parameters, etc.</td>
</tr>
<tr>
<td>Replacement of consumable parts</td>
<td>Replaces consumable parts, such as a sensor, filter, pump, etc.</td>
</tr>
</tbody>
</table>

NOTE: A span adjustment can only be done by RKI.
8-2. How to clean

Clean the detector if it becomes extremely dirty. The detector must be turned off while cleaning it. Use a waste cloth or the like to remove dust. Do not use water or organic solvent for cleaning because they may cause malfunctions. Because an extremely contaminated inside of the taper nozzle may disturb the gas detection, it must be cleaned with dry air, etc.

**CAUTION**

- When cleaning the detector, do not splash water over it or use organic solvents such as alcohol, benzene, etc. on it. Otherwise, it may cause discoloration or damage to the surface of the detector or a sensor failure.

**NOTE**

- When the gas detector gets wet, water may remain in the buzzer sound opening or grooves. Drain water as follows:
  1. Wipe away moisture on the gas detector thoroughly using a dry towel, cloth, etc.
  2. While holding the gas detector firmly, shake it about ten times with the buzzer sound opening facing downward.
  3. Wipe away moisture coming out from the inside thoroughly using a towel, cloth, etc.
  4. Place the gas detector on a dry towel, cloth, etc. and let it stand at normal temperatures.

8-3. Parts replacement

**Hydrophobic filter replacement procedure**

Continuing to use the detector may cause the hydrophobic filter to be contaminated or clogged. Replace the hydrophobic filter if it becomes extremely dirty. Also, replace the hydrophobic filter when it has absorbed water or if a low flow rate is noticed.

1. Turn the cap counterclockwise and remove it.

2. Remove the rubber seal from the cap. The hydrophobic filter is installed in the rubber seal.
3 Replace the hydrophobic filter with a new one. Make sure it’s seated in the rubber seal correctly.

4 Attach the rubber seal, with the hydrophobic filter installed, to the cap. Make sure the rubber seal’s rib has been firmly inserted into the cap’s groove.

5 Attach the cap, with the rubber seal attached, to the main unit.

**Sensor replacement**

The sensor comes with a 1-year warranty. It has a typical life of 2-3 years, depending on the operating environment. The sensor life has expired if, for example, the reading fluctuates or does not come back after a response test. Contact RKI for sensor replacement.

**Battery replacement**

For battery replacement, see "How to replace the batteries" on page 11.
8-4. Response Test

Even though the SP-220 cannot be calibrated in the field, a response test can be done to make sure the sensor is still responsive. This test is NOT meant to replace a calibration and is only meant to be used to determine general sensor functionality.

1. Turn the detector on and wait for it to enter normal operation.

2. Dip a cotton swab in rubbing alcohol with an alcohol concentration of 70% or higher.

3. Hold the cotton swab 1/2 inch in front of the tapered nozzle for 2-3 seconds or until the detector shows a response. It should respond to full scale.

4. Remove the cotton swab and allow the detector to recover from the exposure before using it to monitor an area. This can take up to 30 seconds.

5. If the detector does not respond to full scale, send the detector to RKI for sensor replacement and/or calibration.
9
Storage and Disposal

9-1. Procedures to store the detector or leave it for a long time

The detector must be stored under the following environmental conditions.
- In a dark place under the normal temperature and humidity away from direct sunlight
- In a place where gases, solvents or vapors, etc. are not present

Store the detector in a shipping carton, if any, in which the product was delivered.
Store the gas detector away from dust, etc. if the shipping carton is not available

**CAUTION**
- If the detector is not used for a long time, store it after removing the batteries. Leaks from dry batteries may result in fire or injury.
- If the gas detector is not used for a long time, turn on the power at least once every six months and check that the pump draws in air (about three minutes). The gas detector, when not activated for a long time, may cease to work because of hardening of the grease in the pump motor.

9-2. Procedures to use the detector again

**CAUTION**
- When the detector is used again after a long-period storage, never fail to perform a calibration.
- Contact RKI for information on readjustment including calibration.

9-3. Disposal of products

When the detector is disposed of, it must be treated properly as an industrial waste in accordance with the local regulations, etc.

**WARNING**
- Dispose of dry batteries in accordance with procedure specified by the local authority.
<Disposal in EU Member States>
When disposing of the detector in EU member states, sort the batteries as specified. Handle the removed batteries according to the classified refuse collection system and recycling system based on the regulations of EU member states.

Removing batteries
For battery removal, see "4-3. How to replace the batteries" on page 11.

NOTE
Crossed-out recycle dustbin mark
This symbol mark is indicated on the products which contain the batteries which fall under EU Battery Directive 2006/66/EC. Such batteries need to be disposed of as specified by the latest Directive. This symbol mark indicates that the batteries need to be separated from the ordinary waste and disposed of appropriately.
This Troubleshooting section does not explain the causes of all the malfunctions which occur on the detector. This simply helps to find the causes of malfunctions which may frequently occur. If the gas detector shows a symptom which is not explained in this manual, or still has malfunctions even though remedial actions are taken, please contact RKI.

<tbody>
<tr>
<td>The power cannot be turned on.</td>
<td>The battery level is too low.</td>
<td>Replace both of the two batteries with new ones.</td>
</tr>
<tr>
<td></td>
<td>The POWER button was released quickly.</td>
<td>For power-on, keep the POWER button pressed until a blip is heard.</td>
</tr>
<tr>
<td></td>
<td>Dry batteries are not installed properly.</td>
<td>Check that the batteries are properly installed to the main unit.</td>
</tr>
<tr>
<td>Abnormal operations</td>
<td>Disturbances by sudden static electricity noise, etc.</td>
<td>Turn off the power once and then turn it on again (restart).</td>
</tr>
<tr>
<td>Cannot operate the gas detector.</td>
<td>Disturbances by sudden static electricity noise, etc.</td>
<td>Remove the batteries in a safe place. Then reinstall them and turn on the power to perform operations.</td>
</tr>
<tr>
<td>System abnormalities</td>
<td>A circuit abnormality occurred.</td>
<td>Contact RKI for repair.</td>
</tr>
<tr>
<td>![FAIL SYSTEM]</td>
<td>A sensor has failed.</td>
<td>Remove the batteries in fresh air. Then reinstall them and turn on the power to perform operations. Restart the detector a few times. If the problem still persists, contact RKI to replace the sensor.</td>
</tr>
<tr>
<td>![FAIL SENSOR]</td>
<td>The battery level is low.</td>
<td>Turn off the power and replace the dry batteries with new ones in a safe area.</td>
</tr>

<tr>
<td><strong>Power supply</strong></td>
<td>AA alkaline battery: 2</td>
<td></td>
</tr>
<tr>
<td><strong>Continuous operating time</strong></td>
<td>12 hours or more (normal temperature, without alarms or lighting)</td>
<td></td>
</tr>
<tr>
<td><strong>Operating environment</strong></td>
<td>Operating temperature range: -20 - +55ºC Operating humidity range: 95%RH or less (Non-condensing)</td>
<td></td>
</tr>
<tr>
<td><strong>External dimensions</strong></td>
<td>External dimensions: 43 (W) x 200 (H) x 39 (D) mm (projection portions excluded)</td>
<td></td>
</tr>
<tr>
<td><strong>Weight</strong></td>
<td>Weight: Approx. 215 g (without batteries)</td>
<td></td>
</tr>
<tr>
<td><strong>Drip-proof and dust-proof performances</strong></td>
<td>Equivalent to IP-55</td>
<td></td>
</tr>
<tr>
<td><strong>Functions</strong></td>
<td>LCD backlight (automatically lights up in response to an alarm), Data logger, Log data display, Peak hold, Clock display, Changing a reading target gas</td>
<td></td>
</tr>
<tr>
<td><strong>Accessories</strong></td>
<td>2 AA alkaline dry batteries, Hand strap, Rubber protection cover, Replacement waterproofing filter (5 pcs), Taper nozzle</td>
<td></td>
</tr>
</tbody>
</table>

* The gas concentration is only approximate because the detector is designed to be used to detect a small amount of gas leakage.
## 12-1. Definition of terms

<table>
<thead>
<tr>
<th>Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vol%</td>
<td>Gas concentration indicated in the unit of one-hundredth of the volume</td>
</tr>
<tr>
<td>ppm</td>
<td>Gas concentration indicated in the unit of one-millionth of the volume</td>
</tr>
<tr>
<td>LEL</td>
<td>The acronym of Lower Explosive Limit. LEL refers to the lowest concentration of a combustible gas in air capable of causing explosion when ignited.</td>
</tr>
</tbody>

Declaration of Conformity

We, RIKEN KEIKI Co., LTD.

2-7-6, Azusawa, Itabashi-ku,
Tokyo 174-8744 Japan

declare in our sole responsibility that the following product conforms to all the relevant provisions.

Product Name: Portable Gas Monitor
Model Name: SP-220
2014/30/EU(From 20 April 2016)
RoHS : 2011/65/EU
RoHS : EN 50581(2012)
Year to begin affixing CE Marking: 2016
Place: Tokyo, Japan
Signature: Tetsuya Kawabe
Full Name: Tetsuya Kawabe
Date: Mar 31, 2016
Title: Director, Quality control center
